“Don’t get hooked on me, cause I’ll just use you then set you free” - Mac Davis

Phishing attacks are one of the most common security challenges that companies face in keeping their information secure. Whether it's getting access to passwords, credit cards, or other sensitive information, hackers are using email, social media, phone calls, and any form of communication they can to steal valuable data and use this private information to commit identity theft.

Don't Get Hooked

Phishing scams vary widely in terms of their complexity, the quality of the forgery, and the attacker's objective. Several distinct types of phishing have emerged such as spear phishing, whaling, and tabnabbing. These scams attempt to trick recipients into responding or clicking immediately, by claiming they will lose something.

Because phishing relies more on targeting people versus technology, it is sometimes referred to as a type of social engineering attack. Since phishing generally does not try to install malware like Trojan horses or keyloggers, regular antivirus and anti-malware may not help protect against it.

Act Before You're Hacked

Phishing is a huge problem and even sophisticated users can fall victim. PROTEUS' CyberVigilance™ service can identify known phishing emails for YOU and also recognize dangerous websites that aren't who they say they are. Connect with PROTEUS by emailing CV@proteuseng.com to learn how to detect, mitigate, and prevent these types of attacks.
